

Logistic Regression

↳ it is a classification Algorithm.

0.67 →

$$\text{Sigmoid}(z) = \frac{1}{1 + e^{-z}}$$
$$= \frac{1}{1 + e^{-(\text{model})}}$$

$z = 100 \Rightarrow 1$

multiclass classification

Supervised learning

- ↳ SVM
- ↳ Random Forest
- ↳ Naive Bayes

} L1 and L2 Regression

unsupervised learning Algorithms

1. Start with k centroids by putting them at random place Here $k=2$

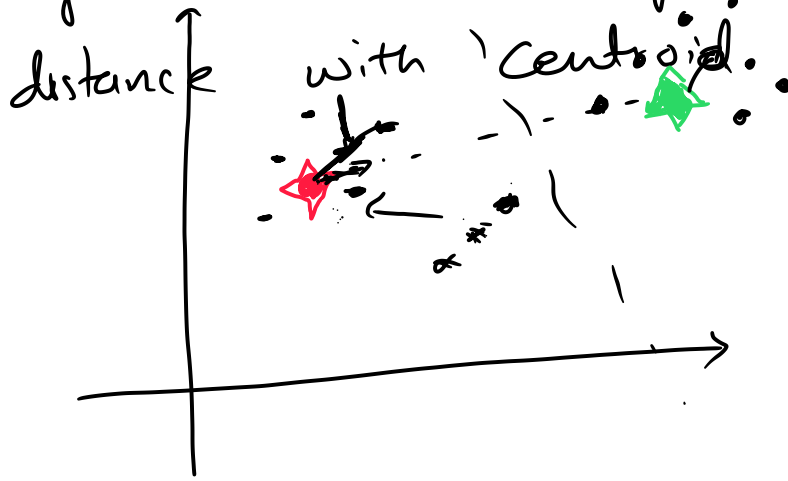

2. Compute distance of every point from centroid and cluster them accordingly

3. Adjust centroids so that they become center of gravity for given cluster

4. Again re-cluster every point based on their distance with centroid.

(5)

(SSE)

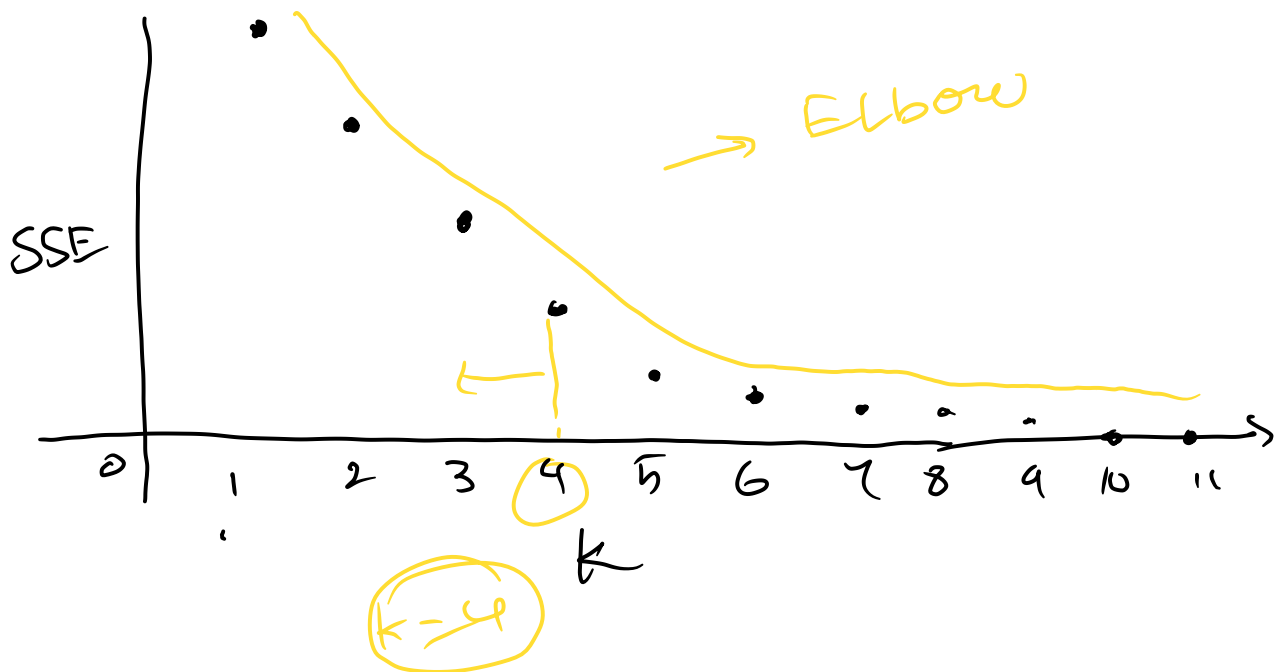

6. Recompute clusters and repeat this till data points stop changing cluster.

$$SSE_1 = \sum_{i=0}^n \text{dist}(x_i - c_1)^2$$

$$SSE_2 = \sum_{i=0}^n \text{dist}(x_i - c_2)^2$$

$$SSE = [SSE_1 + SSE_2 + \dots + SSE_k]$$

MinMax Scaler

① Equalizing feature influence

Age Income

18-80 10000 $\Rightarrow \sqrt{(\Delta \text{Income})^2 + (\Delta \text{Age})^2}$

0-1

| Age | Income |
|-----|---------|
| 55 | \$50000 |
| 44 | \$45000 |
| 25 | \$30000 |

0.85000 ←
 $55 \rightarrow 1$
 $50000 - 1$
 0.85 ←
